

SOC 2 Type I Summary (Simulated)

SIMULATED / FICTIONAL EVIDENCE — FOR EDUCATIONAL USE ONLY

Document ID	SOC2-T1-2025-09
Version	Customer summary 1.0
Report type	SOC 2 Type I (simulated)
Trust Services Criteria	Security and Availability
As-of date	30 September 2025
Fictional firm	Harbor & Pike LLP
Opinion (simulated)	Unqualified as to design of described controls as of the as-of date

1. Important limitation

A Type I report describes the suitability of the design of controls at a point in time. It does not provide the same assurance as a Type II report regarding whether controls operated effectively over a period. CloudFlow has engaged a Type II examination targeting issuance in calendar year 2026. This summary is fictional and is not a real SOC report.

2. System description (excerpt)

The system is CloudFlow CRM hosted on AWS (us-east-1) with encrypted data stores, centralized logging, identity federation, and a documented incident response process. Complementary user entity controls include tenant administration, MFA for customer users, and appropriate use of API keys.

3. Notable complementary points for TPRM

- Physical data-center security is inherited from AWS.
- The examination did not include subprocessors beyond AWS as carved-out or included; customer TPRM should still review CloudFlow's subprocessor process.
- No qualified opinion on design was issued in this simulated Type I.
