

Subprocessor Management Summary

SIMULATED / FICTIONAL EVIDENCE — FOR EDUCATIONAL USE ONLY

Organization	CloudFlow Technologies (fictional SaaS vendor)
Product in scope	CloudFlow CRM
Classification	Confidential — Internal Use / Simulated Evidence
Approval status	Approved for simulation (not a live corporate record)
Document owner	Jordan Hale, Chief Information Security Officer
Document ID	TPRM-SP-001
Version	1.1
Effective date	01 August 2025
Last inventory review	20 January 2026

1. Purpose

This summary describes how CloudFlow Technologies inventories and reviews subprocessors that support CloudFlow CRM.

2. Inventory (illustrative, fictional)

- Amazon Web Services — infrastructure hosting, United States regions.
- Northmail Delivery (fictional) — transactional email.
- PulseAnalytics Cloud (fictional) — product telemetry (no payment data).

3. Review practice — disclosed weakness

Subprocessors are reviewed, but there is no fully standardized formal risk scoring process. AWS is treated as a strategic provider with contractual flow-down, SOC reports on request, and architecture review. Smaller utility providers may be onboarded after Legal review of DPA language and a security questionnaire that is not scored against a documented residual-risk scale. Re-reviews occur at least annually for named subprocessors, but the depth of review is not consistent. Customers receive 14 days' notice of material subprocessor additions where practicable.

4. Intended improvement

Security intends to introduce a scored subprocessor assessment (likelihood, impact, residual rating, and approval) for all critical subprocessors. Until that procedure is approved and executed, an assessor should rate formal subprocessor risk assessment as only partially effective.
